Catalase-peroxidase of Caulobacter crescentus: function and ro

Stationary-phase survival.*;

J. Bacteriol. 179:6831-6836(1997).

C -1- FUNCTION: BITUNCTIONAL, EXHIBITING BOTH A CATALASE AND

BROAD-SPECTRUM PEROXIDASE ACTIVITIES.

C-1- CATALYTIC ACTIVITY: DONGR + H(2)O(2) - OXIDIZED DONOR + 2 H

C -1- COATALYTIC ACTIVITY: DONGR + H(2)O(2) - OXIDIZED DONOR + 2 H

C -1- COATALYTIC BY EXPOSURE TO HYDROGEN PEROXIDE.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Peptides AAY01812-14 exemplify the peptide of the invention, which is used in a peptide composition to affect a biological process characterized by abnormal cell migration through a physiological barrier, to inhibit pai-1-dependent adhesion of a cell to a tissue, to promote clearance of scupA from the surface of a mammalian cell, and to impede pathological migration of a cell in a mammal. The composition can be used to affect a biological process characterized by abnormal cell migration through a physiological barrier, where the process is selected from anglogenesis, organogenesis, overwhelm of the process is selected from anglogenesis, organogenesis, overwhelm of the process is selected from anglogenesis, organogenesis, overwhelm of the process is selected from anglogenesis, organogenesis, overwhelm of the process is selected from anglogenesis, organogenesis, overwhelm of the process is selected from anglogenesis, organogenesis, overwhelm of the process is selected from anglogenesis, organogenesis, overwhelm of the process is selected from anglogenesis, organogenesis, overwhelm of the process is selected from anglogenesis, organogenesis, overwhelm of the process is selected from anglogenesis, organogenesis, organoge
This sequence represents human alpha-1-antitrysin cterminal peptide fragment 6. Alpha-1-antitrypsin is a known inhibitor of serine proteases, but loses its inhibitory activity due to a change in tertiary structure when cleaved by proteases such as leukocyte elastase. The cleaved alpha-1-antitrypsin molecules are cleared from the circulation through receptors in the liver and is accompanied by a depletion of extracellular cholesterol. The cause of this cholesterol depletion is due to an increase in the number of low density lipoprotein (LDL) receptors in liver cells which take up the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Alpha-1-antitrypsin; fragment; low density lipoprotein; LDL; latherosclerosis; gallstone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence

This invention takes advantage of the fact that there is an increase in LDL receptor levels induced by the presence of cleaved alpha-1-antitrypsin and it derivatives, including C-terminal peptide fragments. The C-terminal peptide fragments (AAY42733-Y42749) can be used to reduce the levels of LDL cholesterol in a patient and can be used to treat a wide variety of disorders, including atherosolerosis, hypercholesterolaemia and gallstones. As the peptides are derived from a naturally occurring human serum protein, they should not produce immune
The present invention describes a modified therapeutic peptide (I) comprising a therapeutically active amino acid region (III) and a reactive group (II) (e.g. succinimidyl and maleimido groups) attached to a less therapeutically active amino acid region (IV), which covalently bonds with amino/hydroxyl/thiol groups on blood components to form a peptidase stabilised therapeutic peptide composed of 3-50 amino acids. (I) are useful for modifying therapeutic peptides e.g. hormones, growth factors and neurotransmitters, to protect them from peptidase activity in vivo for the treatment of various dispraces. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the body. Modifying and attaching therapeutic peptides to albumin prevents or

The mutant PAI-1 is used to prevent reocclusion. It binds to vitronectin to act as a strong thrombin inhibitor, but is much less effective as a PA inhibitor. See also AAR11755 and AAR12162-3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New plasminogen activator inhibitor 1 (PAI-1) mutants - comprise region of antithrombin III (ATIII), useful in fibrinolytic-thrombolytic therapy

This sequence comprises mature PAI-1 in which residues 344-349 (1.e.SerAlaArgMetAlaPro) in the reactive centre has been replaced by AlaGlyArgSerLeuAsn from the corresponding site of ATII. The mutant PAI-1 is used to prevent reocclusion. It binds to vitronectin to act as a strong thrombin inhibitor, but is much less effective
                                                                                   New plasminogen activator i region of antithrombin III thrombolytic therapy
                                                                 Claim

human plasminogen activator inhibitor (PAI-1) mature protein (see also AAW31587). It has an Ala for Arg substitution at amino acid cresidue 346, i.e. in the reactive centre loop of the protein. The mutant can be obtained by site-directed mutagenesis of PAI-1 DNA (see AAW36710-25) have at least one amino acid substitution at position 343-350, especially at position 343 and/or 346, and may have additional stabilising mutations comprising between one and four of His-50, Thr-154, Leu-319 and Ide-354, and one or more of Arg-333, Arg-335, Gly-331, Ile-372 and Leu-91. The mutants are characterised by being resistant to inactivation by elastrase, plasminogen activator, plasmin, cathepsin G, chymase, gelatinases A and B, stromelysin and collagenase, and by having a high affinity that thoological elastase activity (specifically in emphysema, adult

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           cc alpha 1-antitrypsin deficiency, cystlc fibrosis, atopic dermatitis, congenital pancreatitis, periodontal disease, arthritis and HIV infection). Pancreatitis, periodontal disease, arthritis and HIV infection). Cc They also inhibit Vn-stimulated cell attachment, migration and/or migration-induced proliferation (specifically in atherosclerosis, compost-angioplasty restenosis, neonitima formation after vascular trauma, vascular graft restenosis, fibrosis (associated with channel or chemotherapy, or of the lung), wound channel or metastases, psoriasis, deep vein thrombosis and any condition involving pathological angiogenesis (all claimed). Since the mutants are resistant to cleavage by the proteases to which they bind, they are more effective therapeutic agents. They also promote uptake and clearance of elastase (or its complex with PAI-1) or promote uptake and clearance of elastase (or its complex with PAI-1)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       δõ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CC residue 346, i.e. in the reactive centre loop of the protein The CC mutant can be obtained by site-directed mutagenesis of PAI-1 DNA CC (see AAT97303) and expression in a host cell. Claimed pAI-1 mutants CC (see AAX25710-25) have at least one amino acid substitution at CC position 343-350, especially at position 343 and/or 346, and may CC have additional stabilising mutations comprising between one and CC four of His-150, Thr-154, Leu-319 and Ile-354, and one or more of CC Arg-333, Arg-335, Gly-331, Ile-372 and Leu-91. The mutants are CC characterised by being resistant to inactivation by elastase. Acc plasminogen activator, plasmin, cathepsin G, chymase, gelatinases A CC and B, stromelysin and collagenase, and by having a high affinity CC for vitronectin (vn) and are used, in vivo or in vitro, to inhibit CC respiratory distress syndrome, acute lung inflammation, congenital CC replasmintity, periodontal disease, arthritis and HTV infection) CC majoration-induced proliferation (specifically in atheroscierosis, CC majoration-induced proliferation (specifically in atheroscierosis, CC majoration-induced proliferation (specifically in atheroscierosis, CC past-angioplasty restenosis, neolitima formation after vascular trauma, vascular graft restenosis, fibrosis (associated with condition involving pathological angiopenesis (all claimed). Since the mutants are resistant to cleavage by the proteases to which cc they bind, they are more effective therapeutic agents. They also by romote uptake and clearance of elastase (or its complex with PAI-1) CC by receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

It has a Gly for Arg substitution at amino acid CC residue 346, i.e. in the reactive centre loop of the protein. The Cd mutant can be obtained by site-directed mutaqenesis of PAI-1 DNA (see AAP37303) and expression in a host cell. Claimed PAI-1 mutants (see AAW26710-25) have at least one amino acid substitution at position 343-350, especially at position 343 and/or 346, and may four of His-150, Thr-154, Leu-319 and ILe-354, and one or more of four of His-150, Thr-154, Leu-319 and ILe-391. The mutants are characterised by being resistant to inactivation by elastase, and set of condition at the parameter of the plasminogen activator, plasmin, cathepsin G, chymase, gelatinases A cc and B, Stromelysin and collagenase, and by having a high affinity for vitronectin (Vn) and are used, in vivo or in vitro, to inhibit comparation and collagenase, and by having a high affinity caphalogical elastase activity (specifically in emphysema, adult respiratory distress syndrome, acute lung inflammation, congenital comparation induced proliferation (specifically in emphysema, adult respiratory distress syndrome, acute lung inflammation and/or They also inhibit vn-stimulated cell attachment, majoration and/or comparation involving pathological angiospensis (alsociated with Chronic inflammation or chemotherapy, or of the lung), wound chealing with scarring and fibrosis, growth/invasion of primary tumours or metastases, psoriasis, deep vein thrombosis and any condition involving pathological angiospensis (alsociated with Chronic inflammation are resistant to cleavage by the proteases to which compared to promote uptake and clearance of elastase (or its complex with pAI-1) promote uptake and clearance of elastase (or its complex with pAI-1) compared to the standard of the standard condition involving energy and condition the condition condition the pathological angiospension of prima

This polypeptide comprises a preferred mutant, Plasp (R346D), of CC human plasminogen activator inhibitor (PAI-1) mature protein (see also AAW31887). It has an Asp for Arg substitution at amino acid CC residue 346, i.e. in the reactive centre loop of the protein. The mutant can be obtained by site-directed mutagenesis of PAI-1 DNA CC (see AAW19730) and expression in a host cell. Claimed PAI-1 mutants (see AAW19730) and expression in a host cell. Claimed PAI-1 mutants (comparision 343-350, especially at position 343 and/or 346, and may CC have additional stabilising mutations comprising between one and CC four of His-150, Thr-154, Leu-319 and Ine-354, and one or more of CC plasminogen activator, plasmin, cathepsin G, chymase, gelatinases a CC and B, stromelysin and collagenase, and by having a high affinity CC pathological elastase activity (specifically in emphysema, adult CC respiratory distress syndrome, acute lung inflammation, congenital cathepsin G, chymase, gelatinases a CC alpha 1-antitrypsin deficiency, cystic fibrosis, atopic dermatitis, CC pancreatitis, periodonntal disease, arthritis and HIV infection), CC migration-induced proliferation (specifically in emphysema, adult craspinatory distress syndrome, acute lung inflammation, congenital CC alpha 1-antitrypsin deficiency, cystic fibrosis, atopic dermatitis, CC pancreatitis, periodonntal disease, arthritis and HIV infection), They also inhibit Vn-stimulated cell attachment, migration and/or Migration-induced proliferation (specifically in atherosclerosis, CC migration induced proliferation (specifically in atherosclerosis, CC condition involving pathological angiogenesis (all claimed). Since the mutants are resistant to cleavage by the proteases to which they are more effective therapeutic agents. They also condition involving pathological angiogenesis (all claimed). Since the sunday are more effective therapeutic agents. They also condition in the condition of eleatance of elastase (or its complex with PAII-1) CC pathological angiogenesis (all claime
                                             by receptors.

(NB. the amino acid sequence of the mutant protein was obtained by adaptation of the wild-type sequence provided in Fig 4A of the specification).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Plasminogen activator-inhibitor type I mutant inhibits elastase - has high affinity for vitronectin, for therapeutic inhibition of elastase or vitronectin-mediated cell attachment, migration etc.

RESULT ANAW26714 ANAW26714
CC This polypeptide comprises a preferred mutant, P4Ala (V343A), of CC Inman plasminosen activator inhibitor (PAI-1) mature protein (see CI also AAW31387). It has an Ala for Val substitution at amino acid CC residue 343, i.e. in the reactive centre loop of the protein. The mature AMP37303 and expression in a host cell Claimed PAI-1 mutants CC (see AAW26710-25) have at least one amino acid substitution at position 343-350, especially at position 343 and/or 346, and may CC have additional stabilising mutations comprising between one and CC Arg-333, Arg-333, Gly-331, Ile-372 and Leu-91. The mutants are CC characterised by being resistant to inactivation by elastase, CC plasminogen activator, plasmin, cathepsin G, chymase, gelatinases A CC and B, stromelysin and collagenase, and by having a high affinity CC pathological elastase activity (specifically in emphysema, adult CC respiratory distress syndrome, acute lung inflammation, congenital CC alpha 1-antitrypsin deficiency, cystic fibrosis, atopic dermatitis, periodontal disease, arthritis and HIV infection). They also inhibit Vn-stimulated cell attachment, migration and/or mayartion-induced proliferation (specifically in atherosclerosis, CC trauma, vascular graft restenosis, fibrosis (associated with cc chronic inflammation or chemotherapy, or of the lung), wound cc healing with scarring and fibrosis, growth/invasion of primary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Plasminogen activator-inhibitor type I mutant inhibits elastase has high affinity for vitronectin, for therapeutic inhibition of elastase or vitronectin-mediated cell attachment, migration etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Plasminogen activator inhibitor type 1; PAI-1; human; elastas; inhibitor; vitronectin; cell attachment; cell migration cell proliferation; emphysema; adult respiratory distress syndrom acute lung inflammation; alpha 1-antitrypsin deficiency; cystic fibrosis; atopic dermatitis; pancreatitis; periodontal disease; arthritis; HTV; atherosclerosis; restenosis; neointima; fibrosis; wound healing; tumour; metastasis; psoriasis; https://doi.org/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.1001/10.10

They promote uptake and clearance of elastase (or its complex with by receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Plasminogen activator inhibitor type 1; PAI-1; human; elastas; inhibitor; vitronectin; cell attachment; cell migration, cell proliferation; emphysema; adult respiratory distress syndrom acute lung inflammation; alpha 1-antitrypsin deficiency; cystic fibrosis; atopic dermatitis; pancreatitis; periodontal disease; arthritis; HV; atherosclerosis; restenosis; periodontal disease; arthritis; HV; atherosclerosis; propositions; fibrosis; wound healing; tumour; metastasis; psoriasis
This polypeptide comprises a preferred mutant, P4Asp (V343D), of human plasminogen activator inhibitor (PAI-1) mature protein (see also AAW31587). It has an Asp for Val substitution at amino acid residue 343, i.e. in the reactive centre loop of the protein. The mutant can be obtained by site-directed mutagenesis of PAI-1 DNA (see AAW367302) and expression in a host cell. Claimed PAI-1 mutants (see AAW367302) have at least one amino acid substitution at position 343-350, especially at position 343 and/or 346, and may have additional stabilising mutations comprising between one and
                                                                                                                                                                                          Plasminogen activator-inhibitor type I mutant inhibits elastase has high affinity for vitronectin, for therapeutic inhibition of elastase or vitronectin-mediated cell attachment, migration etc.
                                                                                                                                                                                                                                                           WPI;

CC four of His-150, Thr-154, Leu-319 and Ile-354, and one or more of CC characterised by being resistant to inactivation by elastase, CC plasminogen activator, plasmin, cathepsin G. Chymase, gelatinases A CC and B. stromelysin and collagenase, and by having a high affinity CC for vitromectin (Yn) and are used, in vivo or in vitro, to inhibit CC pathological elastase activaty (specifically in emphysema, adult CC respiratory distress syndrome, acute lung inflammation, congenital CC alpha 1-antitrypsin deficiency, cystic fibrosis, atopic dermatitis, periodontal disease, arthritis and HIV infection). CC migration-induced proliferation (specifically in atherosclerosis, constraints) periodontal disease, arthritis and HIV infection). CC migration-induced proliferation (specifically in atherosclerosis, constraints) are resistant to community in atherosclerosis, condition inflammation or chemotherapy, or of the lung), wound channed in inflammation or chemotherapy, or of the lung), wound condition involving pathological angiogenesis (all claimed). Since they bind, they are more effective therapeutic agents. They also promote uptake and clearance of elastase (or its complex with PAI-1) by receptors.

Query Match and clearance of the mutant protein was obtained by adaptation of the wild-type sequence provided in Fig 4A of the Securities of the wild-type sequence provided in Fig 4A of the Matches 6; Conservative 0; Mismatches 0; Indels 0; Gaps 0; buther in the Security of the wild-type sequence provided in Fig 4A of the Search completed: March 18, 2002, 09:48:56

seq. ō,

```
Pred. No. is the number of results predicted by chance to have
score greater than or equal to the score of the result being
and is derived by analysis of the total score distribution.
